Project Abstract Submission Form

Sec No- 9	Team No- 2	Project Title- Ticket Booking System (Concurrency-Safe)
-----------	------------	---

1. Abstract

(Summarize the project idea, problem background, and proposed solution. Not more than 250 words.)

The **Universal Ticket Booking System** is a web-based platform designed to provide a secure, reliable, and convenient solution for booking tickets for different types of events such as **movies, concerts, sports, theatre, comedy shows, and other live events**. The system connects customers, organizers, and verifiers through a single platform.

Customers can register, log in, search and filter events, view event and venue details, select ticket categories and quantities, make payments, view booking history, and manage cancellations and refunds. Organizers can register, submit verification details, create venues with seating plans, publish events, and manage bookings after approval. Verifiers review organizer applications and approve or reject them to maintain platform reliability.

The system is developed using **React.js** for the frontend, **Java Spring Boot** for the backend, and **MySQL** for database management. **Redis** can be used for concurrency control to prevent problems such as multiple users attempting to book limited tickets simultaneously, while **Apache Kafka** can support asynchronous event and notification processing. The system aims to provide a scalable, organized, and user-friendly ticket booking experience with proper authentication, verification, booking, payment, and cancellation management.

2. Team Details

Roll Number(s)	Name of the Student	Signature
2520030025	V.Hemanth	
2520030266	K.CHAITANYA	
2520030532	CH.VIVEK	

3. Frameworks / Platforms / Software Used

(List the frameworks, libraries, platforms, or tools you plan to use.)

- **Java** – Backend programming language
- **Spring Boot** – Backend application framework
- **Spring Data JPA / Hibernate** – Database interaction and ORM
- **MySQL** – Relational Database Management System
- **Redis** – Distributed locking, caching, and concurrency control
- **Apache Kafka** – Asynchronous message processing
- **React.js** – Frontend development
- **Maven** – Dependency management and build automation
- **Postman** – REST API development and testing
- **Git & GitHub** – Version control and source-code management
- **VS Code / IntelliJ IDEA** – Development environment
- **Docker Desktop** – Containerisation and deployment
